

ALA:- 1**1. Explanation****Solution:-****Error 1: Indentation Error**

Python uses indentation to define blocks of code. In the given program, the statements inside the while loop and if condition are not properly indented, which causes an IndentationError.

Wrong:

```
while num > 0:  
digit = num % 10
```

Correct:

```
while num > 0:  
    digit = num % 10
```

Error 2: Missing Colon in else Statement

In the given code, the print statement inside else block is missing a closing parenthesis.

Wrong:

```
else:  
    print("More non-zero digits"
```

Correct:

```
else:  
    print("More non-zero digits")
```

Error 3: Logical Flow Issue

If indentation is not correct, the loop and conditions will not execute properly. All statements inside while and if must be properly aligned.

Correct Program:

```
print("Digit Frequency Counter")  
num = int(input("Enter number: "))  
zero = 0  
other = 0
```

```
while num > 0:  
    digit = num % 10
```

```
if digit == 0:
    zero = zero + 1
else:
    other = other + 1
num = num // 10

print("Zero digits:", zero)
print("Other digits:", other)

if zero > other:
    print("More zeros")
else:
    print("More non-zero digits")

total = zero + other
print("Total digits:", total)
```
